# What is Composite Bonding?

Composite Bonding is a cosmetic treatment completed by Dr Chris Ibbott. Composite Bonding is a non invasive way to improve your smile and can help teeth which may have chips, gaps or fractures. There are different techniques used for composite bonding, some tried and tested and others which are newer. Prices start from £395 per tooth.

DENTAL CLINIC

# Free Hand Composite Bonding

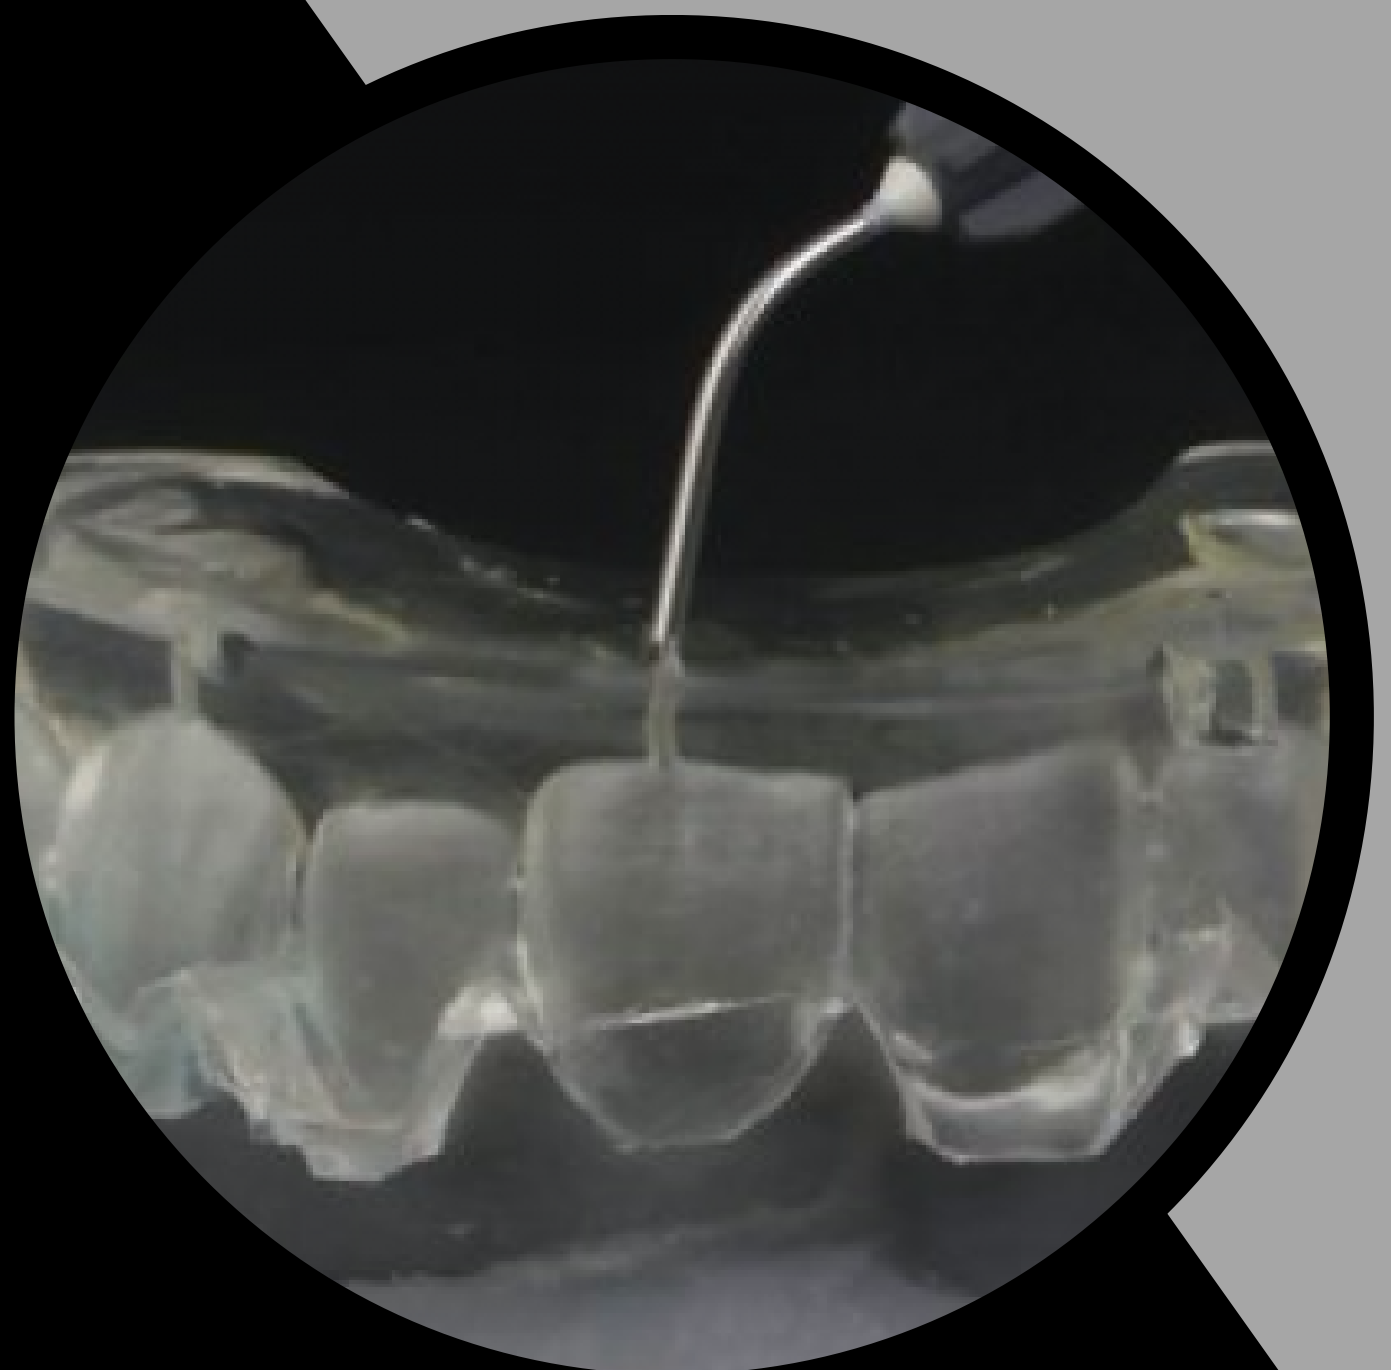

A tried and tested material and method where composite bonding is completed by hand, building the teeth up naturally, shaping them to best fit your mouth and smile.

# VS

A newer technique and material where composite bonding is completed by injecting flowable composite into a lab made device which has a pre-defined tooth shape.

# Injection Moulded Composite Bonding

# Free Hand Composite Bonding

This is completed in the dental chair and timings of appointments differ from patient to patient. Each case is looked at on a case by case basis and some larger cases may need a lab made digital smile design.

Whether you are having **edge bonding** or **composite veneers** the process is similar. First the teeth will be etched (roughened) to allow us to bond the composite resin material to the tooth.

Following this Chris works meticulously, building up each tooth to enhance your smile.

Finally all the teeth are shaped and polished for the big reveal!

DENTAL CLINIC

# Injection Moulded Composite Bonding

This is completed in the dental chair and timings of appointments differ from patient to patient as each case is looked at and designed on a case by case basis.

Injection moulded bonding involves the use of a custom mould being used to help shape your natural teeth with the white composite material.

Once this is complete the teeth are shaped and polished for the big reveal!

# BEFORE

---

Worn edges of the front 6 teeth

# AFTER

---

All 6 front teeth restored with  
composite bonding
